

Enterprise Architecture AI Knowledge Agent

A governed documentation platform for discovering, contributing and reusing trusted EA knowledge.

Conversational discovery

Controlled repository

Lifecycle governance

Claude API

Architecture and proof-of-concept proposal

One governed knowledge experience — not another repository.

Discover

Find current, approved EA knowledge through search, browse and conversation.

Contribute

Upload files or register links with complete metadata and tags.

Govern

Control ownership, approval, classification, versions and review dates.

Reuse

Open sources, related artifacts, templates, decisions and prior versions.

The AI experience is only trustworthy when the content lifecycle underneath it is **trustworthy**.

What the requirements actually ask us to build.

AI KNOWLEDGE AGENT

FR-001–012

Grounded conversation, latest approved answers, citations, related content and safe abstention.

INGESTION & REPOSITORY

FR-013–023

Files and links, metadata extraction, duplicates, ownership, versions and managed storage.

SEARCH & DISCOVERY

FR-024–035

Keyword, semantic, metadata and tag search with filters, sorting and prior versions.

TAGGING & METADATA

FR-036–045

Controlled taxonomy, required tags, suggestions, audit and curator controls.

LIFECYCLE & HISTORY

FR-046–052

Approval states, current version, immutable history, reviews and remediation.

6 user roles

12 governance controls

8 reporting needs

10 acceptance tests

Six roles. One controlled knowledge lifecycle.

Human governance remains authoritative; the agent assists but does not approve.

Discover, contribute, govern and reuse — in one journey.

Discover

Ask questions · search · browse tags
· filter and sort · identify latest approved

Contribute

Upload files · register links · extract metadata
· confirm AI-suggested tags

Govern

Review · approve · classify · assign owner
· schedule review · supersede

Reuse

Open sources · compare versions · follow related artifacts
· download when authorized

SAMPLE — ILLUSTRATIVE DATA

Q Show the latest Insurance technology strategy.

A Current approved · v4.2 · Owner: EA Insurance

Insurance Tech Strategy 2025

EA Domain Roadmap — Insurance

Governed content first. Permission-aware intelligence second.

Content enters through a governed front door.

Initial-release target: PPTX · DOCX · XLSX · PDF · Visio · images · Markdown · text · architecture diagrams · supported links

POC begins with PDF, DOCX, PPTX and one registered link/transcript.

Find the latest approved answer — and prove it.

Current wins

Approved/current material is prioritized; drafts and history are labeled.

Evidence travels

Every answer exposes openable source items.

No source, no claim

The agent states when authoritative information cannot be found.

Metadata and taxonomy are the control plane.

REQUIRED METADATA

- Title
- Owner
- Upload date
- Version
- Topic/domain
- Audience
- Review date
- Description
- Contributor
- Last updated
- Segment
- Content type
- Lifecycle
- Source location

CONTROLLED TAG CATEGORIES

Audience	INTERNAL · EXTERNAL
Segment	INSURANCE · CENTERWELL · GROWTH · CORPORATE · ENABLER · ENTERPRISE
Governance	TRB · ARB · POLICY · STANDARD · PATTERN · DECISION
Domain	DATA · AI · SECURITY · CLOUD · INTEGRATION · API · PLATFORM
Type	STRATEGY · ROADMAP · TEMPLATE · PROCESS · REFERENCE_ARCHITECTURE
Lifecycle	DRAFT · REVIEW · APPROVED · SUPERSEDED · ARCHIVED

AI may suggest tags; a contributor confirms them. Classification never overrides permissions.

Authority is a lifecycle — not a tag.

Authoritative = owner + approval + current version + review date + audience classification

Current version

One approved version per artifact family.

History

Immutable versions, approvals, metadata changes and transitions.

Currency

Scheduled reviews and reminders; stale or unowned content flagged.

Audience

External requires explicit approval; superseded stays available through history.

Enterprise controls surround every knowledge interaction.

Identity & access

- Enterprise SSO / RBAC
- Source permissions respected
- Least privilege
- Permission-aware results

Information protection

- Encryption
- Secrets management
- Retention, privacy, legal hold
- Audience classification

AI assurance

- Grounded generation & citations
- Injection defense
- Sensitive-data checks
- Safe abstention & output validation

Operations & reporting

- Immutable audit
- Ingestion & index health
- Low-confidence searches
- Content quality · security · availability monitoring

Architecture target: 100,000+ artifacts without redesign of the core information model. POC performance is not a production-scale certification.

Controls and provider terms remain subject to client security, privacy, legal and architecture review.

Prove the governed journey before widening the boundary.

IN THE POC

- ✓ Insurance segment; 1–2 architecture domains
- ✓ 100–300 artifacts from one approved SharePoint site
- ✓ PDF, DOCX, PPTX plus one registered link/transcript
- ✓ Test personas for all six roles
- ✓ Mandatory metadata, controlled tags and lifecycle states
- ✓ Hybrid search, tag explorer and grounded Claude answers
- ✓ 2+ permission groups and baseline content-quality reports

OUT OF THE POC

- ✗ PII, PHI, customer/member and claims data
- ✗ All formats, sources, domains and business segments
- ✗ Production external publication
- ✗ Autonomous approvals or architecture decisions
- ✗ Automatic modification of source documents
- ✗ 100,000-artifact production load certification

The POC validates the core information model, controls and acceptance journey.

One demonstration covers all ten acceptance criteria.

The demo succeeds on evidence, not on conversational polish alone.

A six-week path to a defensible POC.

Exit gate: Go · refine · stop — based on acceptance evidence.

Timing assumes timely tenant access, provider approval and business-owner decisions.

Traceability from requirement families to the POC.

Requirement family	POC treatment	Post-POC expansion
FR-001–012 · AI agent	Core flow, citations, current answers, related items, abstention	Broader journeys and richer conversation
FR-013–023 · Ingestion	Selected formats, one link, metadata, duplicates, versions	All formats and source integrations
FR-024–035 · Search	Hybrid search, filters, sorting, browse and history	Enterprise scale and tuning
FR-036–045 · Tags	Required taxonomy, suggestions and audit	Bulk operations and advanced curation
FR-046–052 · Lifecycle	States, approval, current version, review and flags	Enterprise notifications and remediation automation
GR-001–012 · Governance	Core ownership, authority, audit and permission controls	Policy hardening and external workflows
RR-001–008 · Reporting	Baseline content quality and operational evidence	Full analytics and exports
NFR-001–005 · Platform	Design controls and representative tests	Scale, resilience and formal assurance
AC-001–010 · Acceptance	All ten demonstrated	Production acceptance suite

Based on requirements visible in the supplied source images; implementation choices remain subject to validation.

Make four decisions — then build one complete journey.

1

Business

Choose the first knowledge journey, content owner and representative corpus.

2

Governance

Approve taxonomy, authority rules, Internal/External policy and retention.

3

Technology

Select managed storage and search; confirm sources, identity and integration route.

4

AI provider

Approve Claude route, region, retention terms and permitted data classifications.

First milestone: **an approved artifact moves through governance and becomes the current, cited answer for an authorized user.**
